

IN THE ABSTRACT:

Please amend the Abstract as follows:

~~It is aimed to provide a~~ A bone-conduction speaker device which makes no leakage of sound annoying the other and does not restrict posture and rolling-over motion of the user when lying on a bed or sitting on a sofa, and which makes highly reliable and excellent transmission and receiving of sound signal as to enable ~~enjoying of music or the like~~ listening with almost no locational restrictions. The speaker device comprises: a transmitter converting the inputted sound signal into output of infrared signal and then transmitting it; a receiver demodulating the inputted infrared signal into the sound signal; a bone-conduction speaker amplifying the sound signal and outputting it as sound vibration; and a pad-shaped elastic cushioning body holding on its surface the bone-conduction speaker, thereby forming a pad embedded with the bone-conduction speaker(s). Photo-acceptors for the receiver are arranged on fringe of the cushioning body as spaced apart to each other.
